

Pevco Sentry™

Pevco Sentry™ provides facility engineers with automated email notification of pneumatic tube system transaction details, advisories and alarms. Sentry communicates with cell phones, laptops or any other email-enabled device.

Since Sentry is as easy to use as email, staff training is not required. Sentry improves communication, productivity and response time by allowing staff to receive notifications wherever they are.

Pevco Sentry:

- **Improves response time.**
Notification of system-generated advisories and alarms allows staff to react quickly.
- **Minimizes downtime.**
When a station is out of service because of a full carrier bin, maintenance staff is instantly alerted.
- **Prevents misplaced products and patient care delays.**
Facility engineers are notified when carriers fail to liftoff or reach their destinations.

Sentry can be customized to communicate with all levels of pneumatic tube system engineers and managers. By filtering emails to each addressee by station and type of event, communication is streamlined. System engineers receive only the critical information they need to keep the system—and their facility—running smoothly.

Sentry is included standard with Pevco computer control centers equipped with Smart System software v2.28.0 or higher. Systems running earlier versions of the software can be upgraded by a Pevco service technician.

Most major cellular service providers convert emails to text messages, so even standard cell phones will receive Sentry messages.
